Association of ERCC1 expression with p53 accumulation in malignant melanoma. Tumor suppressor gene p53 plays an important role in the cellular response to DNA damage. The ability to recover from DNA damage is regulated by at least two mechanisms, inactivation of p53 and DNA repair capacity. The nucleotide excision repair pathway is one of the major DNA repair pathways. Several reports have demonstrated a relationship between decreased repair activity and increased survival in malignant melanoma. Overexpression of ERCC1, a key protein involved in nucleotide excision repair, was associated with resistance to cisplatin-based chemotherapy and poor survival in patients with malignant melanoma. In this study, we examined the relationships between p53 accumulation, ERCC1 expression and nucleotide excision repair capacity in malignant melanoma. A total of 61 consecutive cases of melanoma were selected for this study and the relative expression of p53, ERCC1 and ERCC2 was examined by immunohistochemistry. We found a significant association of increased expression of ERCC1 with p53 accumulation, and the combination of these two markers was significantly associated with poor outcome. To the best of our knowledge, this is the first study to show a relationship between ERCC1 and p53 accumulation in malignant melanoma.

Title 1 2 3 4 Q: How can I remove duplicate items from a list in c#? For example: List myList = new List(); myList.Add("xxx"); myList.Add("yyy"); Result: I want to remove the second item in the list, i.e. the "xxx". A: if (myList 82157476af
